

Aim:

The army maintains two tables: one for soldiers' details and another for their assignments. The logistics and planning department wants to ensure that only soldiers who are both registered in the army's personnel database and actively assigned to a unit are considered for upcoming training and missions. Your task is to write a query that retrieves the names of soldiers who appear in both the soldiers' details and their assignments.

Tables Design

Table: **soldier_details**

Schema:

Column Name	Data Type	Description
soldier_name	VARCHAR (50)	Name of the soldier
location	VARCHAR (50)	Location of the soldier (e.g., base)

Data Snapshot:

soldier_name **location**

ajay	base_1
vikram	base_2
rajeev	base_3
anil	base_4

Table: **soldier_assignments**

Schema:

Column Name	Data Type	Description
soldier_name	VARCHAR (50)	Name of the soldier
unit	VARCHAR (50)	The military unit the soldier is assigned to
rank	VARCHAR (50)	The rank of the soldier

Data Snapshot:

soldier_name	unit	rank
ajay	infantry	captain
vikram	artillery	lieutenant
manoj	cavalry	major
anil	infantry	captain

Expected Output:

soldier_name

ajay
vikram
anil

Source Code:

user.sql

```
--Type Content here...
SELECT s.soldier_name
FROM soldier_details s
INNER JOIN soldier_assignments a
      ON s.soldier_name = a.soldier_name;
```
